Measuring tread depth at speed possible with new Apollo Vredestein facility

To underline the company's emphasis on road safety and the environment, Apollo Vredestein has unveiled a state-of-the-art laser tread depth measuring station at its Enschede site in the Netherlands. The addition of this new unit, says the tyre maker, will make visitors more aware of the importance of having the correct tread depth in terms of both their safety and the environment. The station was built in accordance with Apollo Vredestein's ISO 14001 environmental certification, as was the tyre pressure station installed by the company in 2008...

The unit can measure tread depth speeds up to 15 km/h
